

WithSecure™ Cloud Protection for Salesforce

Unlock the full potential of your Salesforce platform and run your business undisrupted

Salesforce CRM platform is a backbone of your organization's critical operations. To cyber criminals, on the other hand, Salesforce is a steppingstone. New business outcomes create new attack vectors for attackers to target. Attackers can slip in malicious files such as ransomware or distribute URLs to phishing sites through channels including web forms and emails, for example. This can eventually lead to business disruption, downtime, reputational damage, loss of trust in the eyes of partners and customers, and other material and immaterial loss.

Detect and block advanced cyber threats across your Salesforce cloud environment

Remove malicious content automatically and scan your environment at any time

Know what's happening in your Salesforce environment and make informed decisions

Made with Salesforce for Salesforce

It's your responsibility to eliminate cyber risk related to Salesforce content flows

As a cloud vendor, Salesforce has strict security practices in place to protect the cloud and its infrastructure. The shared responsibility model – a regulatory paradigm in cloud computing – mandates that security responsibilities are split between cloud providers and cloud consumers. According to the shared responsibility paradigm, you as the data owner are responsible of securing the data that flows in and out of your Salesforce environment – nobody else secures it for you.

Reduce risk and deliver a secure digital experience with Salesforce

Sharing content such as files and weblinks is an essential part of Salesforce collaboration but opens cracks into your cyber line of defense. WithSecure™ Cloud Protection for Salesforce automatically detects and blocks malicious files and weblinks across Salesforce clouds and functionalities. Your environment will stay clean of any malware, phishing, or junk content.

How Cloud Protection for Salesforce shields your cloud?

1. A user uploads malicious files or URLs to your Salesforce platform, for example, via web forms, partner portals, emails, or third-party applications.

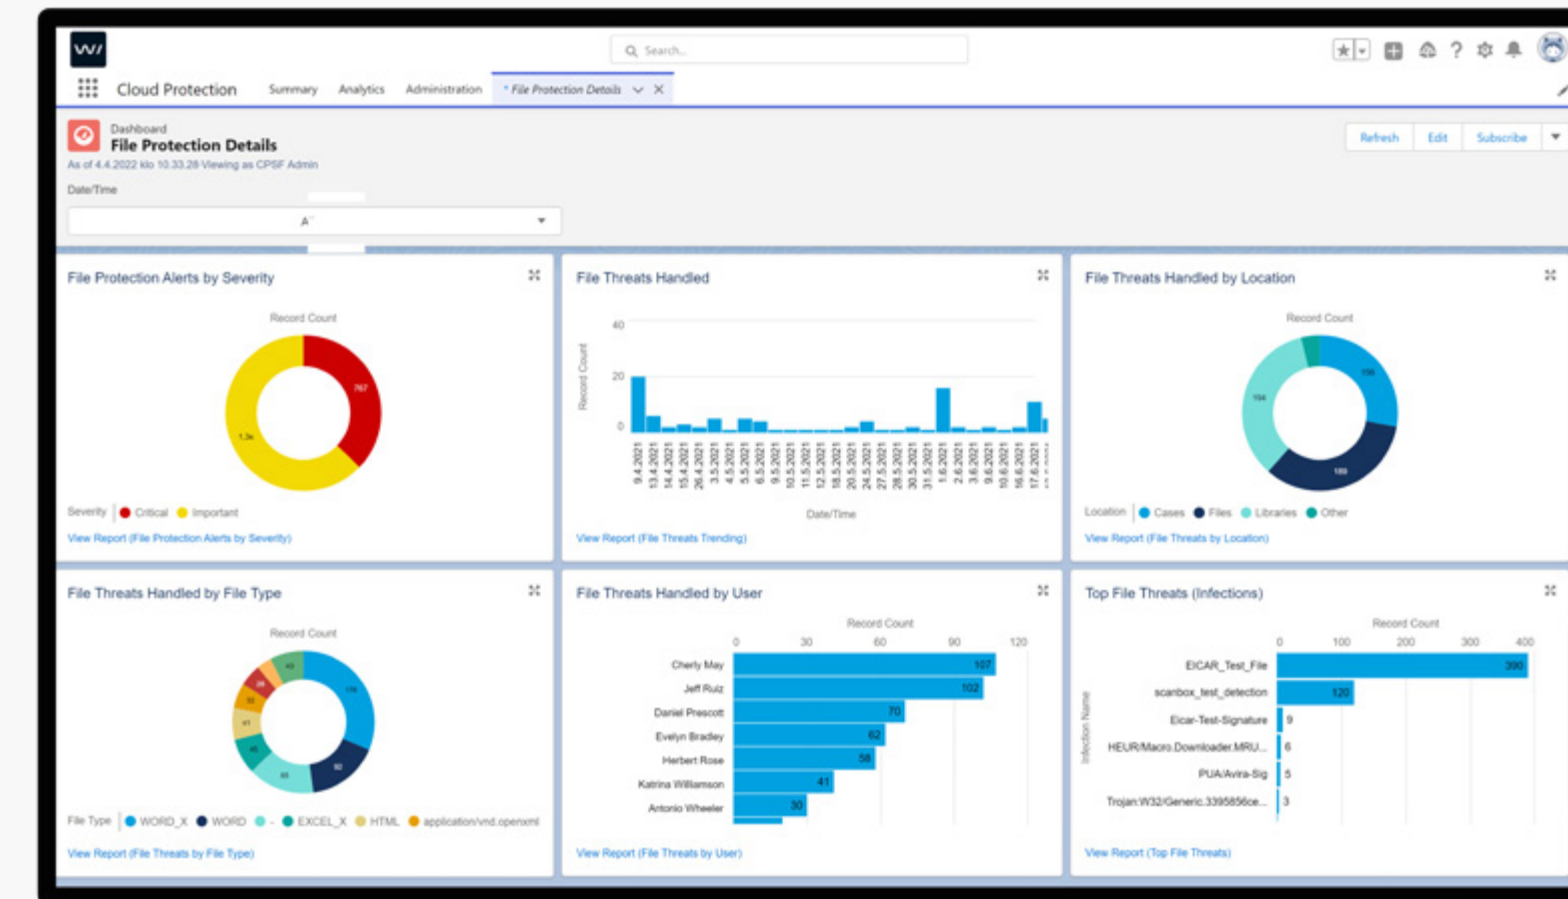

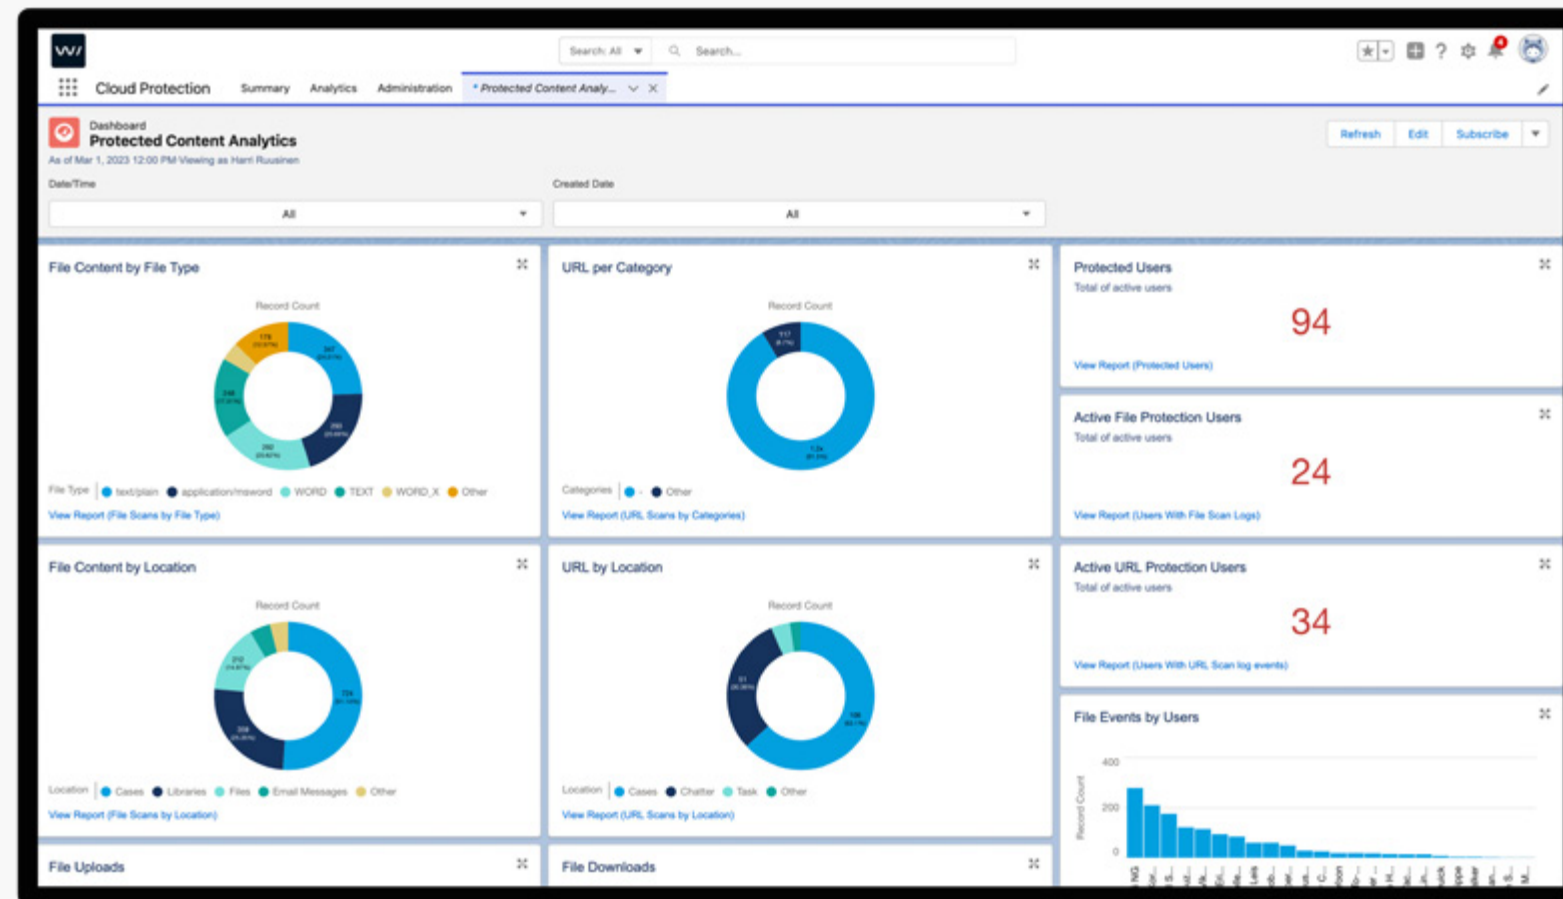

2. WithSecure™ Cloud Protection for Salesforce intercepts and scans all entering and leaving content for threats using a multi-stage threat analysis process. You can also scan your existing content on-demand.

3. When a threat is detected, the content is blocked from your users. Your admins are automatically alerted.

4. Your incident response is sped up by advanced security analytics with full audit trails.

You can easily integrate metadata, alerts, and workflows to your SIEM or other centralized security systems.

Instant and constant protection

Prevent data breaches by stopping malware, ransomware and phishing attacks

Prevention is the most cost-effective defense. Protect your digital business from advanced cyber threats by proactively preventing any malicious content from piercing into your Salesforce cloud environment.

Have real-time security information at your fingertips

Get clarity of your content security status and see what is happening in your environment in real-time. Get full forensics trails to power your incident investigation and threat hunting.

Plug-and-play security – made with Salesforce

With click-and-go deployment you get instant value in use – no tedious implementation projects to slow you down. No surprise hosting costs on the horizon.

Embrace the full potential of your Salesforce cloud

Safe customer engagement and collaboration

Make collaboration efficient and your customers' lives easier and safer with secure digital journeys – free from malicious content and disruption.

Enjoy the efficiency of Salesforce without disruption

Automatically detect and block malicious files and URLs your users upload. Your administrators can focus on impactful work, and there's zero impact on your cloud platform's performance and customizations.

Enable compliant and secure cloud adoption without speedbumps

Meet your security policy requirements and dodge compliance obstacles while digitally transforming your business with Salesforce.

Reliable protection

Our threat analysis service has distributed hosting across multiple regions and availability zones across Europe and USA, ensuring reliable delivery without a single point of failure. WithSecure™ Cloud Protection for Salesforce is ISO 27001 and ISAE 3000 Type 2 (SOC2 Type 2) compliant.

Salesforce customers see on average 49% faster resolution times and a whopping 26% increase in revenue.
